#	Enterprise LLM Evaluation Dataset - Test Case Generator Agent	_EMPTY
1	Application under test	Testleaf AI Test Case Generator - an LLM agent embedded in a QA/test-management platform (e.g. a Jira/TestRail plugin) that takes an Agile user story as input, retrieves the relevant acceptance criteria from a requirements repository, and drafts a structured set of QA test cases for a human tester to review and refine. This shortest test-authoring time and standardises coverage across a QA team. Five representative user stories are used across sheets: Password Reset, Checkout, File Upload, Search & Filters, and Multi-Factor Authentication
2	Why this shape of dataset	Mirrors how llm-eval-providers/deepeval_server.py builds a DeepEval LLMTestCase for every request. Here: input = the user story, retrieval_context = the acceptance criteria retrieved for that story, actual_output = the agent's generated test cases, expected_output = the reference test suite a QA lead would author. Each sheet targets one implemented metric with 5 cases missing correct generation with realistic agent failure modes (missed requirements, fabricated features, biased test personas, leaked real-looking

This JSON is ready to be used for batch evaluation in Step 3

Evaluation Metrics from Excel

The 'Metrics' column in your Excel file will be used for each row's evaluation. Each row can have a different metric (faithfulness, answer_relevancy, etc.). Rows with NA or missing metric values will use answer_relevancy as default.

Response

5,214 tokens 1,535 in 1,647 out \$0.002

METRIC: CONVERSATION COMPLETENESS

SCORE: 1.0000

VERDICT: COMPLETE

EXPLANATION

The score is 1.0 because the LLM response fully satisfied the User's intention to 'greet the assistant', addressing the request perfectly with no omissions.

Here's a user story: As a registered user, I want to reset my password via email so that I can regain account access if I forget it. Please generate test cases.

Assistant

Here are the positive test cases: TC1 verifies the reset email is sent, TC2 verifies the link works and expires after 30 minutes, TC3 verifies the new password must meet complexity rules.

User

Good start! can you also add negative test cases, like what happens with an invalid or already used reset link?

Assistant

Added: TC4 verifies an expired reset link shows an appropriate error and does not allow a password change, and TC5 verifies a reset link cannot be reused a second time after the password has already been changed with it.
