

Third level chat bot implementation with vibe coding using claude
Added attachment icon to the chatbot to upload pdf and get the details from the pdf.

Attached the MD file

Invoice Chatbot – PDF Upload Feature Setup

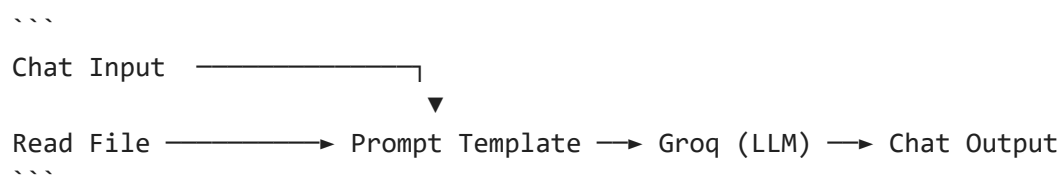

A quick reference for how the attach/upload feature was added to the chat widget.

Why the default widget wasn't enough

The plug-and-play ``langflow-chat`` widget has no attach/upload button – it only sends typed text. To let users upload a PDF and ask about it, we replaced it with a custom-built chat UI that can call Langflow's API in two steps.

Step 1: Set up the Langflow flow

Built a flow with these components, wired in this order:

- **Read File** loads the uploaded PDF's content → feeds the ``file_content`` variable
- **Chat Input** carries the typed question → feeds the ``user_query`` variable
- **Prompt Template** combines both into one prompt for the LLM
- Tested in the Langflow **Playground** to confirm it correctly answers invoice date/amount questions before building anything else

****Noted down:****

- Read File's component ID (``Controls`` panel → shown at top): ``File-kEuH4``
- Flow ID (from the URL): ``e380c9d5-a8c1-48cb-9821-7166c4c9014f``
- A **Langflow API key** (Settings → Langflow API Keys – separate from the Groq key)

Step 2: Build a custom chat UI

Replaced ``<langflow-chat>`` with a self-contained HTML/CSS/JS widget (``invoice-chat-widget.html``) that includes:

- A 📎 attach button that opens a file picker (PDF only)
- An upload step: sends the PDF to Langflow's ``/api/v1/files/upload/{flow_id}``, gets back a ``file_path``
- A send step: sends the typed question to ``/api/v1/run/{flow_id}``, passing the

uploaded file's path into the Read File component via ``tweaks``:

```
```json
{ "File-kEuH4": { "path": ["<uploaded file path>"] } }
```
```

- Displays the bot's reply in the chat window

Step 3: Fix the CORS upload failure

Uploading from the browser failed with a ``422`` on an ``OPTIONS`` request – the local Langflow server wasn't answering the browser's automatic CORS preflight check correctly.

****Fix:**** built a small local proxy (``proxy_server.py``, Python standard library only) that sits between the browser and Langflow:

- The browser calls the proxy (``http://127.0.0.1:5001``) instead of Langflow directly
- The proxy forwards the request to Langflow ****server-to-server****, where CORS doesn't apply
- This also moved the API key out of the HTML file and into the proxy script, so it's no longer visible in the page source

How to run it

1. Add your Langflow API key to ``proxy_server.py``
2. Start Langflow (port 7860)
3. Start the proxy: ``python proxy_server.py`` – leave the terminal open
4. Open ``invoice-chat-widget.html`` in a browser
5. Attach a PDF, ask a question, confirm the reply matches what Playground gave

Files involved

| File | Purpose |
|---|---|
| <code>`invoice-chat-widget.html`</code> | The chat UI shown to users (attach button, chat window) |
| <code>`proxy_server.py`</code> | Local server that bypasses the CORS issue and hides the API key |

Known limitation

The attachment clears after each question – to ask a second question about the same file, it needs to be re-attached. (This can be changed later if persistent attachments are needed.)
